Module 7.2: Learn - Coding

Reviewing and commenting your code

While writing code to do the analysis you want to do, you are focused on getting the code to work. After you have gotten your code working and analyzed the results, it is important to go back through your code and add descriptions to help you remember (or other people learn) what you have done.

Go through all of the Rmds you have created for this course. For each one, do the following:

1. Add comments that tell you what all the variables and functions are supposed to be doing
2. Add notes in comments or descriptions between chunk to tell a new user how to use your code
3. In places in your code that you ran into a problem, add a comment to help another user from running into that same problem

This process will help you to remember what all you have learned in this course and get you in the habit of preparing your code to pass off to others.
